LAB 14

A dot that becomes the next map

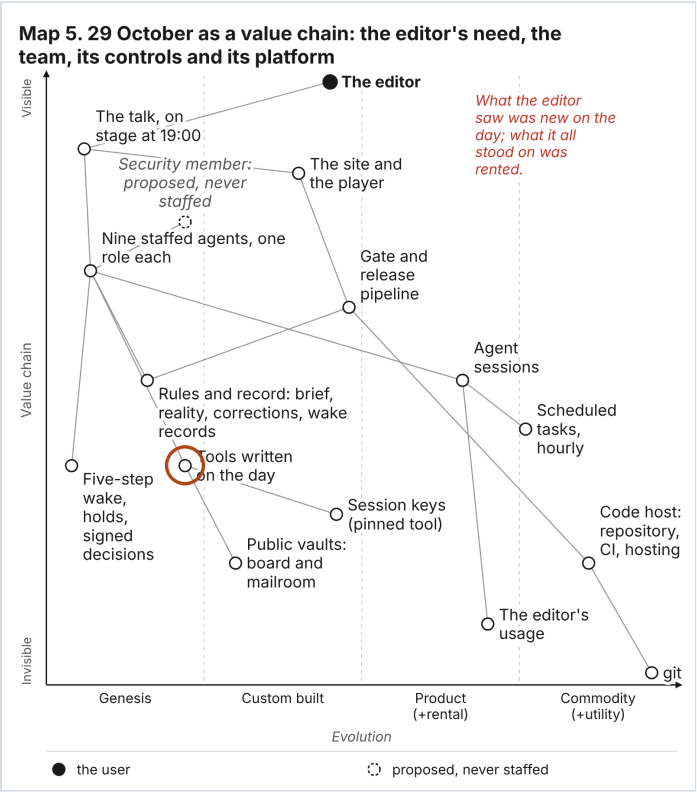

TRIES The editor's RC1 review, T10: a fractal Wardley map. Three frames: the day's value chain with one dot ringed, a lens where that dot opens, and the map that was inside it, so a reader sees that every part on a map can be mapped again.

MADE FROM

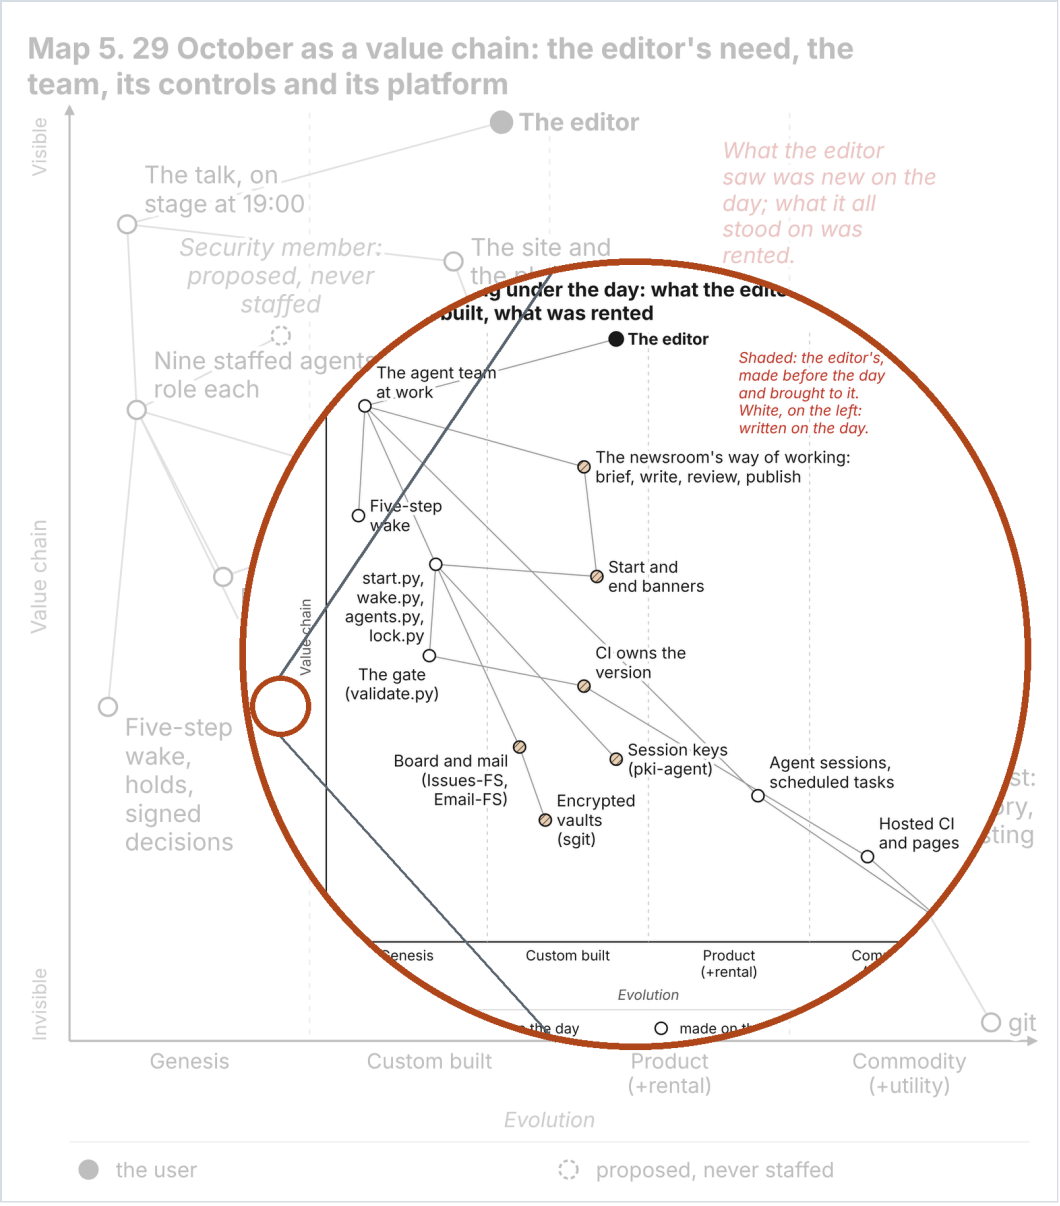

- `team/conductor/rc1/maps/05-the-day-as-a-value-chain.json` and 06-the-plumbing-under-the-day.json, the illustrator's images at `42f0b94` (read only)
- the editor's RC1 review, T10 (`team/conductor/rc1/editor-review/notes.json`)

THE QUESTION Does the zoom make the idea of a map within a map clear on paper? Is three frames right, or would two (the dot, then the map) do?

☐ **keep** ☐ **change** ☐ **drop** note

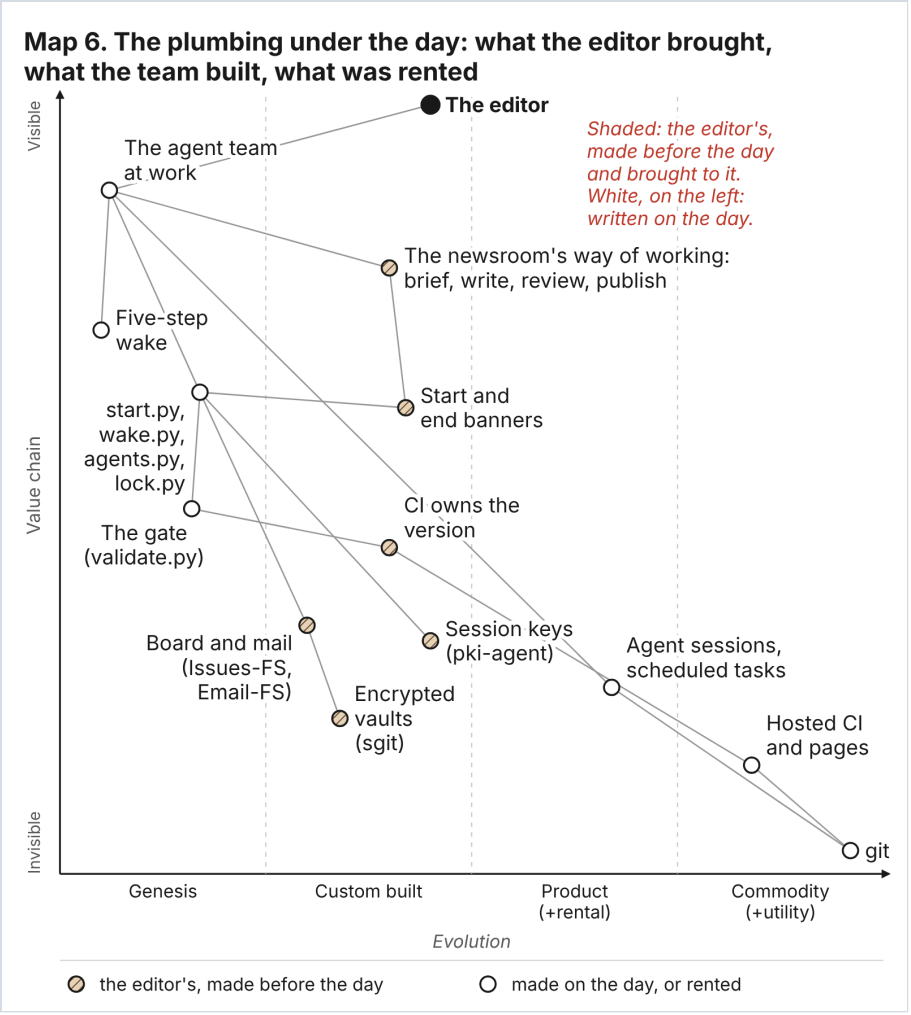

1 The day, as one value chain. Pick one dot: the tools written on the day.
Every dot on a map is a whole map of its own, if you look closely enough.

2 Look into the dot.

The dot opens into the plumbing under the day: what the editor brought, what was written on the day, and what was rented.

3 The dot was a map all along.

Map 6: the plumbing under the day. Each of its dots could open again.

The maps are the illustrator's for RC1, unchanged but for the ring and the lens: `team/conductor/rc1/maps/05-the-day-as-a-value-chain.json` and `06-the-plumbing-under-the-day.json`, images at `42f0b94`. Positions are readings of the record, not measurements, as the maps themselves say.
