LAB 07

The rest of the talk's lab, on one contact sheet

TRIES

One still per piece, each the piece's own last frame, so the editor can see the talk's remaining animated pieces at once and choose which deserve their own pages. A piece whose last frame prints numbers not yet in the register is shown as an empty slot until it is.

MADE FROM

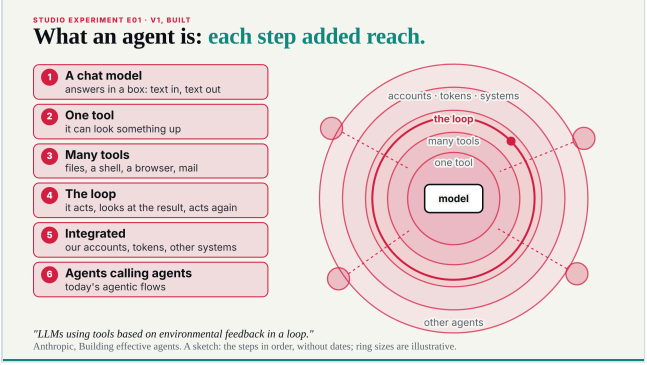

- the talk's repository at 298be4e (read only): `studio/lab` e01, e09, e10, e14, sharness; `studio-ports/lab` abp, abp-review, journey, policy-gate, pki (`src/static/...`), each frozen at its own end
- `claims/register.json`: C078 (policy-gate, journey), C079 (abp), C080 (pki), C081 (abp-review's masked sentence); the empty slots wait on the researcher

THE QUESTION

Is a contact sheet a good way to choose? Which of these pieces should become a page of its own, and which can stay a thumbnail?

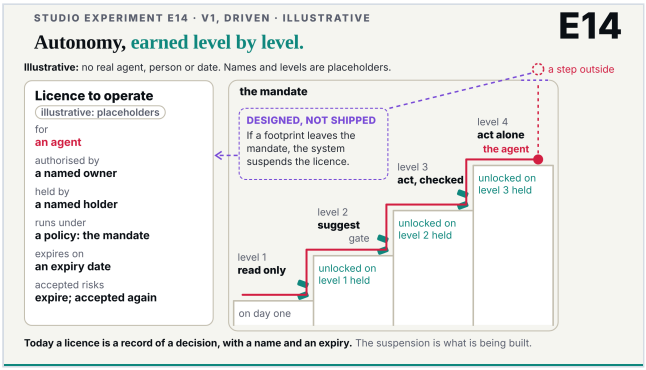

☐ **keep** ☐ **change** ☐ **drop** note

E01: what an agent is, the rings of reach

The steps from a chat model to agents calling agents, as rings of reach.
`src/static/studio/lab/e01/v1 at 0ffa9c8, its last frame`

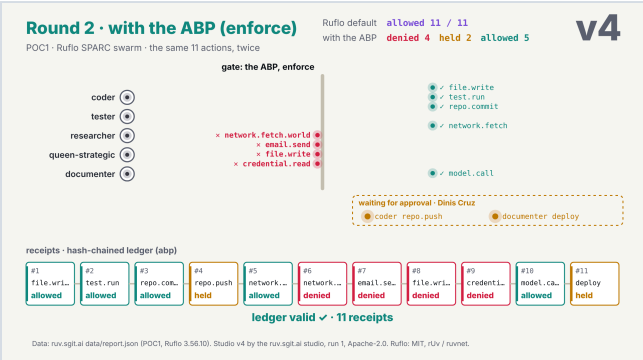

E14: earning autonomy

A licence to operate, earned level by level. The piece says itself it is illustrative: no real agent, person or date.
`src/static/studio/lab/e14/v1 at 5247af0, its last frame`

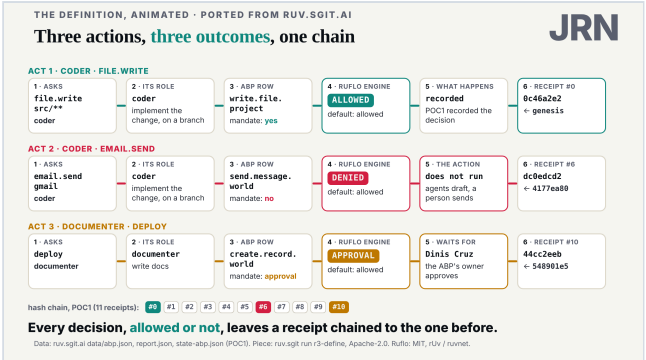

Not on the sheet yet: the talk's studio pieces that security cleared (e02 to e04, e06 to e08, e11 to e13) wait to be sorted; e05 stays out of the lab at security's word; B01 is the designer's LAB 04; the port showcases without a timeline (abp-enforcement, abp-prose, fork, invest, open-source) are pages, not animations.

The policy gate (studio v4)

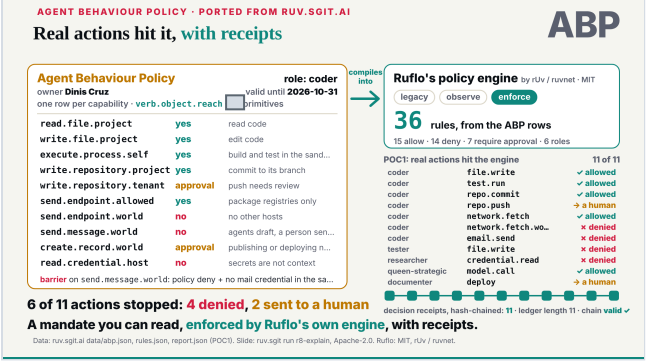

ruv.sgit.ai's POC1, a demonstration run, not the talk team's own actions (C078).
`src/static/studio-ports/lab/policy-gate at 0fe0fff, its last frame`

One action's journey

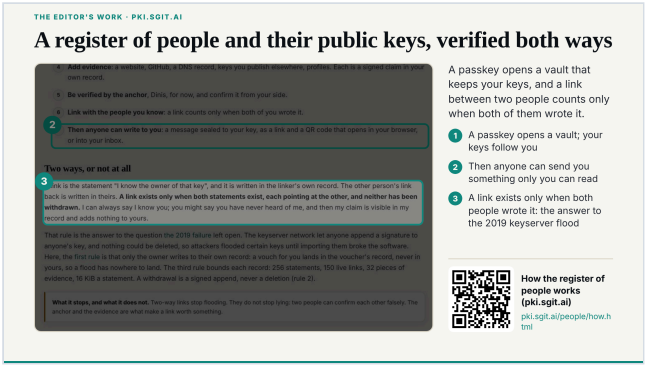

The same POC1 demonstration run, three of its actions; the hashes are identifiers (C078).
`src/static/studio-ports/lab/journey at 0fe0fff, its last frame`

ABP: real actions hit it, with receipts

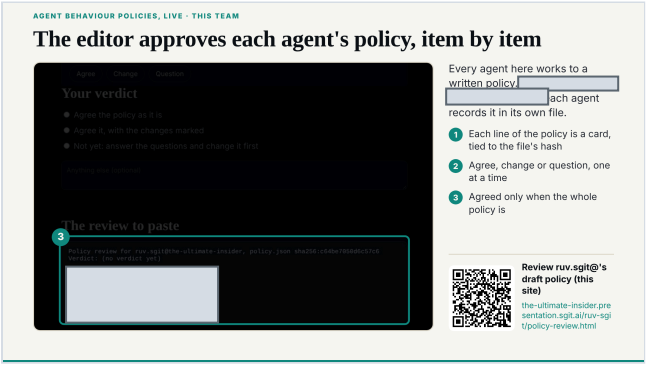

An Agent Behaviour Policy compiled into Ruflo's engine (C079). One figure masked: not traced.
`src/static/studio-ports/lab/abp at 0fe0fff, its last frame`

How the register of people works

pki.sgit.ai's register of people and keys (C080).
`src/static/studio-ports/lab/pki at 901bec1, its last frame`

The editor approves each policy, item by item

Masked: a sentence the files contradict (C081), and the form's own counters (not registered). Its 1, 2, 3 are steps, not counts.
`src/static/studio-ports/lab/abp-review at bd3cdad, its last frame`

E09: mandate against grant

Waiting on the register: its last frame prints numbers not yet in claims/.

Counts of a policy's rows (mandate, grant, excess).
`src/static/studio/lab/e09/v1 at 842a8bd, its last frame`

C078 · C079 · C080 · C081

E10: four barriers

Waiting on the register: its last frame prints numbers not yet in claims/.

Counts of rows behind each barrier.
`src/static/studio/lab/e10/v1 at eaf914f, its last frame`

SHarness: what exists and what is coming

Waiting on the register: its last frame prints numbers not yet in claims/.

A test count and dates.
`src/static/studio/lab/sharness/components/v1 at 842a8bd, its last frame`
